

The IMS Tagged Equipment application tracks all aspects of engineered tagged items, from placement of the purchase order to fabrication and shipment to receipt, installation and preservation during storage and prior to startup.

Tagged equipment items are linked to construction work packages, module and platform assembly and the planning application, allowing for viewing or running of look ahead reports and status details.

Critical details are known ahead of the shipment of tagged items, avoiding cost overruns in transportation and offloading at end destinations. With remote access capabilities for users, reports can be viewed or run to identify current status, as well as estimated and actual delivery details.

Standard Features

- Data import/export
- Engineered tagged equipment data sheets
- Link of engineered tagged equipment to construction work packages and/or module/platforms
- Tracking of tagged equipment delivery and drawing status
- Component parts and spare parts for engineered items
- Preservation requirements
- Tagged item purchase order creation
- Receipt, storage and issue of tagged items and components
- Engineered tagged item reporting
